COOLUINGEL

*These pigeons are AI generated, not wild pigeons

Digital Pigeon for Policy

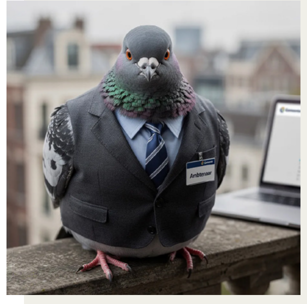
The pigeon is everywhere in the city. Every city. They are migrants. They are loved, hated , people have kept them for their own hobbies and they have had jobs to carry our post. They're bilingual animals: neither wild nor domestic. And everyone seems to have opinions about them. But what do we really know about pigeons? And could we take their needs into account in desicion making?

AI-MAPS started this more-than-human quest together with Parai to see if we could catch the voice of the pigeon somehow. Together with the University of Utrecht (Vivian and Jens) we gathered all academic knowledge that could influence how pigeons are effected by big events in the city. What if they can now talk along when these events are planned?

Three different forms of pigeon representation

Knowledge Partner → Knowledge base → source to answer → Presents findings (english/dutch)

Stakeholder → Knowledge base → source to answer → add emotion → Presents findings from a specific perspective



Signaling pigeon → Knowledge base → Plays a sound + animation
